Practitioner: Ollie  
Patient: Dog : Labrador Retriever  
Species/Breed: 6.5 Years  
Age: female  
Gender: 3/30/2017 10:14:11PM  
Submitted Date: 3/31/2017 2:55:37PM  
Completed Date:

**Case status: Completed**

### Case notes:

Ollie is a 6.5 year old Labrador retriever. We are looking to grade her hips, clear her elbows and shoulders

### The report:

377317 KW/lb

Five digitalized radiographic images containing projections of the pelvis and elbows were submitted for evaluation. The radiographs are dated 03/28/17.

#### Radiographic Findings:

Both femoral heads are located in their respective acetabula and are congruous with the acetabular rims.

Approximately 50% of the femoral heads are located medial to the dorsal acetabular rims.

No osteophyte formation is present on the femoral necks or acetabula.

Alignment of the patellae with the femurs is normal.

Muscle volume in both hind legs is within normal limits.

The anconeal process of both ulnae and proximocranial aspect of both radii are smooth with no evidence of osteophyte formation.

No sclerosis is associated with the ulnar notches.

Both medial coronoid processes are smooth in contour and a fragment associated with the medial coronoid processes is not identified.

Radiologic Diagnosis: Normal pelvis and elbows.

Comments: Radiographic changes to suggest elbow or hip dysplasia are not present. Based on the OFA scheme of evaluating the hips, the hips would be rated as good in conformation. The clinical status of the patient will determine if further assessments radiographically would be indicated. The lack of change to suggest elbow or hip dysplasia would allow this patient to be used in a breeding program.
